What should I do if I test positive for COVID-19?

Monoclonal antibody therapy acts as a shortcut to boost your immune system with antibodies to help fight COVID-19.

**ARE YOU AT A HIGH RISK OF SEVERE COVID-19 SYMPTOMS?**

- **65 YEARS** or older
- **12 YEARS** or older with:
  - Overweight or obesity
  - Diabetes
  - Heart disease
  - High blood pressure
  - Chronic kidney disease
  - Weakened immune system
  - Pregnancy
  - Asthma (moderate to severe)
  - COPD

See a more comprehensive list of high-risk factors.

**HOW DO ANTIBODIES HELP TREAT COVID-19?**

- Antibodies are part of the body’s immune system defending against viruses and bacteria.
- Developed in the lab, not the body, monoclonal antibodies are designed to neutralize the coronavirus.
- When you receive monoclonal antibodies, your body gets an extra boost that could help you steer clear of more severe COVID-19 symptoms.

**WHAT HAPPENS DURING TREATMENT?**

- Receive a one-time outpatient IV infusion
- Get temporary immunity help to fight COVID-19
- Stay home, away from others, for 10 days

If you’ve tested positive for COVID-19, have had symptoms for **10 days** or less, and you are in a high-risk group, ask your healthcare provider if monoclonal antibodies could put you on the road to recovery!

Have a plan to act fast if you test positive for COVID-19.
