ARE YOU AT A HIGH RISK OF SEVERE COVID-19 SYMPTOMS?

- 65 YEARS or older
- 55 YEARS or older with:
  - heart disease, high blood pressure, or a chronic respiratory disease such as asthma or COPD
- 12 YEARS or older with:
  - obesity, diabetes, chronic kidney disease, or weakened immune system

WHAT HAPPENS DURING TREATMENT?

- Receive a one-time outpatient IV infusion
- Get temporary, improved immunity to fight COVID-19
- Stay home, away from others, for 10 days

If you’ve tested positive for COVID-19 in the past and you are in a high-risk group, ask your healthcare provider if monoclonal antibodies could put you on the road to recovery!

Monoclonal antibody therapy acts as a shortcut to boost your immune system with antibodies to help fight COVID-19.

What should I do if I test positive for COVID-19?

Have a plan to act fast if you test positive for COVID-19.

CombatCOVID.hhs.gov

Antibodies are part of the body’s immune system defending against viruses and bacteria.

Developed in the lab, not the body, monoclonal antibodies are very good at fighting the coronavirus.

When you receive monoclonal antibodies, your body gets the extra boost it needs to steer clear of more severe COVID-19 symptoms.

HOW DO ANTIBODIES HELP TREAT COVID-19?

- Antibodies are part of the body’s immune system defending against viruses and bacteria.
- Developed in the lab, not the body, monoclonal antibodies are very good at fighting the coronavirus.
- When you receive monoclonal antibodies, your body gets the extra boost it needs to steer clear of more severe COVID-19 symptoms.
